Q12) What is Software Engineering?

Ans: SE is a disciplined way of developing, testing and maintaining software. Its not just coding, it includes planning, design and testing also.

Q13) Main phases of SDLC?

Ans: 1. Requirement analysis

2. Design

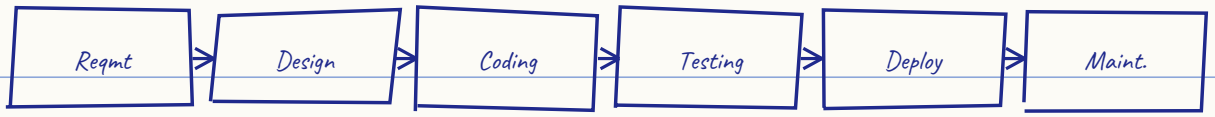

3. Coding/Implementation

4. Testing

5. Deployment

6. Maintenance

Fig: SDLC phases

Reqm analysis finds what customer wants, design decides how to build, testing finds bugs before release. after deployment we fix bugs & add features.

Q14) Explain Waterfall Model.

Ans: Its a traditional model where each phase is done one after another - reqmt, design, coding, testing, deployment, maintenance.

It is simple & easy bcoz sequential. good when reqmts

are fixed. but bad when reqmts keep changing since going back to prev phase is costly & difficult.

Q15) What is software testing? why important

Ans: Testing means checking software to find defects & make sure it works as per requirement.

Its imp bcoz it finds errors before reaching users, improves quality & reliability.

Types - unit testing, integration testing, system testing, acceptance testing.

Q16) Differentiate functional vs non func requirements

Functional = what the system should do

eg. login, check balance, transfer money

Non-functional = how system performs

eg. speed, security, scalability

functional -> features

non functional -> quality & constraints
